Raid® Double Control Ant Baits₁

Raid® Double Control Ant Baits₁ kill the entire colony as the ants carry the poison back to the queen and her nest. Replace bait stations every 30 days or as required.

DIRECTIONS: Separate bait stations from the plastic frame. Peel off tape on bottom of bait and secure to surface. Avoid wallpaper or painted surfaces that may be damaged when replacing baits. Place baits wherever ants are seen: by ant trails or hills, at household entry points, or wherever ants are numerous. Do not place directly over food preparation surfaces or in food storage cupboards.

DISPOSAL: Do not reuse empty container. Wrap container and place in garbage.

PRECAUTIONS: KEEP OUT OF REACH OF CHILDREN Place bait stations in areas inaccessible to children and pets. Do not remove bait from station.

WARNING: CONTAINS EITHER THE ALLERGEN SOY OR PEANUTS.

FIRST AID: If swallowed, call a poison control centre or doctor immediately for treatment advice. Have person sip a glass of water if able to swallow. Do not induce vomiting unless told to do so by a poison control centre or doctor. Do not give anything by mouth to an unconscious person. Take container, label or product name and Pest Control Product Registration Number with you when seeking medical attention.

TOXICOLOGICAL INFORMATION: FOR ADDITIONAL TOXICOLOGICAL INFORMATION, SEE INSIDE BOX.

TOXICOLOGICAL INFORMATION: Chlorpyrifos is an organophosphate that is a cholinesterase inhibitor. Typical symptoms of overexposure to cholinesterase inhibitors include headache, nausea, dizziness, sweating, salivation, runny nose and eyes. This may progress to muscle twitching, weakness, tremors, incoordination, vomiting, abdominal cramps and diarrhea in more serious poisonings. A life-threatening poisoning is signified by loss of consciousness, incontinence, convulsions and respiratory depression with a secondary cardiovascular component. Treat symptomatically. If exposed, plasma and red blood cell cholinesterase tests may indicate degree of exposure (baseline data are useful).

Atropine, only by injection, is the preferable antidote. Oximes, such as pralidoxime chloride, may be therapeutic if used early; however, use only in conjunction with atropine. In cases of severe acute poisoning, use antidotes immediately after establishing an open airway and respiration. With oral exposure, the decision of whether to induce vomiting or not should be made by an attending physician.
